Isolated gilal cell derived neurotrophic factor receptor alpha - Isolated gilal cell derived neurotrophic factor receptor alpha - Isolated gilal cell derived neurotrophic factor receptor alpha - Isolaters, particularly enteric nervous system or kidney disorders is Example 1; Page 6; 100pp; English.

Chis DNA sequence comprises a human EST-derived sequence designated (Critical County) in the catter receptor (CDNFR) sequences, including human country particularly also suitable as probes for GDNFR sequences are another human EST-derived sequence designated ye83h05.r1 (see T84978), and critical country and these EST-derived sequences (see T84980-81) or proteins encoded by them. The invention relates to notive rat (GDNFR and its receptor. In particular, it relates to native rat (GDNFR alpha to see W27327), its variants and soluble derivatives (extracellular domain), chimeric GDNFR alpha and antibodies which bind to the GDNFR alpha, including agonist and neutralising antiodies, as well as various uses for these molecules. It also relates to assay systems for detecting ligands to GDNFR alpha,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Yf Isolated gilal cell derived neurotrophic factor receptor alpha -

Yf useful to develop products to diagnose and treat associated

disorders, particularly enteric nervous system or kidney disorders

Example 1: Page 61: 100pp; English.

Example 1: Page 61: 100pp; English.

This DNA sequence comprises a human EST-derived sequence designated

Ye83h05.rl. It can be used to identify gilal cell derived

neurotrophic factor receptor (GDNFR) sequences, including human

Ye83h05.rl. It can be used to identify gilal cell derived

ye83h05.rl. It can be used to DNFR sequences are another

human EST-derived sequence designated y170a10.rl (see T84979), and

fragments. Also suitable as probes for GDNFR sequences are another

human EST-derived sequence designated y170a10.rl (see T84979), and

fragments of these EST-derived sequences (see T84980-81) or

proteins encoded by them. The invention relates to native rat

GDNFR and its receptor. In particular, it relates to native rat

GDNFR alpha (see W77327), its variants and soluble derivatives

(extracellular domain), chimeric GDNFR alpha and antibodies which

bind to the GDNFR alpha, including agonist and neutralising

antiodies, as well as various uses for these molecules. It also

relates to assay systems for detecting ligands to GDNFR alpha,

systems for identifying GDNF-related conditions, methods for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                        proliferation capacity—and its components and derived antibodies, useful in diagnosing malignant tumours.

Claim 1, Page 73; 106pp; German.

The DNA shown is found in human or animal cells that have an unlimited capacity for unlimited cell proliferation or tumour formation. They have no ability to promote immortalisation of the cells, and are usually found in a DNA-protein complex in the cell cytoplasm. The DNA is useful for detection of these complexes, and diagnosis of malignant tumours. Differentiation between cells with unlimited and only transient proliferation is possible. It can be used as captured developed to dentify glial cell derived neurotrophic factor receptor (GDNFR) sequences, including human variants. The invention relates to novel uses of GDNF and its receptor. In particular, it relates to rat GDNFR alpha (see W27327), its variants and soluble derivatives (extracellular domain), chimeric GDNFR alpha and antibodies which compared to the GDNFR alpha, including agonist and neutralising antiodies, as well as various uses for these molecules. It also crelates to assay systems for detecting ligands to GDNFR alpha, compared to the compared to the physiological role of GDNF, diagnostic conditions, methods for the treatment of GDNF-related conditions, methods for checknidges for identifying GDNF-related and GDNFR alpha-related conditions, particularly kidney disease associated with related and knocknut animals are also claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to rat GDNFR alpha (see w27327), its variants and soluble derivatives (extracellular domain), chimeric GDNFR alpha and antibodies which bind to the GDNFR alpha, including agonist and neutralising antiodies, as well as various uses for these molecules. It also relates to assay systems for detecting ligands to GDNFR alpha, systems for studying the physiological role of GDNF, diagnostic techniques for identifying GDNF-related conditions, methods for identifying molecules homologous to GDNFR alpha, and claimed methods for the treatment of GDNF-related and GDNFR alpha-related conditions, particularly kidney disease associated with glomerulonephritis and enteric nervous system related disorders. Transgenic and knockout animals are also claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated glial cell derived neurotrophic factor receptor alpha useful to develop products to diagnose and treat associated disorders, particularly enteric nervous system or kidney disorders Example 1; Page 61; 100pp; English.

This DNA sequence comprises a fragment of a human EST-derived sequence designated ye83h05.rl (see T8497B). It can be used as a probe to identify glial cell derived neurotrophic factor receptor (GDNFR) sequences, including human variants. The invention relates to novel uses of GDNF and its receptor. In particular, it relates
Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Random point mutations were introduced into the alpha fragment E.Coli beta-galactosidase. The wild type sequence was obtained single stranded template and an oligonucleotide was hybridised
                                                                                                                                                                                                                                                                                                                                                                                                                              Base substituted E.coli beta-galactosidase alpha-fragment. E.coli beta galactosidase alpha-fragment; base substitutions; Escherichia coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

by prepn of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.

Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of
E. coll beta-galactosidase. The wild type sequence was obtained as a
single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all
possible nucleotide positions within a specified region. The
variable 3' ends generated in this way are used as primers for
reverse transcriptase. Nucleotides are misincorporated by the
transcriptase and the molecules are misincorporated by the
amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N81164;

The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                      occurred singularly in any

                                                                                                                                                                                                                                                                                                                                                              PT Identifying proteins or peptide(s) which bind a ligand - by Identifying a recombinant vector library expressing fusion proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing a peneric DNA sequence used to generate random TSAR (Totally CO 70468 is a generic DNA sequence used to generate formula can also be crepresented as follows: X(NNB)11(TGC)(NNB)52(NNB)7(TGC)(NNB)10Y X CO and Y are flanking restriction sites (X is not the same as Y) that are contained for the specific peptides generate by these generic sequences are shown in Q70466-68. CC Other specific peptides generated by these generic sequences are shown in CR5151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with CC cafinity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with CC cafinity for a ligand and a second effector peptide portion that is comprising the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. These residues confer some degree of conformational rigidity to the peptides. The TSARS CC or compsons, comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, call of the conformation of macromolecules, eg. motal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity sequence 114 BP; 0 A; 2 C; 2 G; 2 T;

                                                                                                                                                                                                                                                                                        á
                                                                                                                                                                                                                                                                                                                                                                                                                                              PT Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins promprising a binding domain and an effector domain proteins a sinding domain and an effector domain proteins protein as follows: X(NB)6(TGC)(NNB)112(NNB)44(TGC)(NNB)31X X C comprising a flarking restriction sites (X is not the same as Y) that are cont specified further. Other generic sequences are shown in Q70466-68. CC Other specifies peptides generated by these generic sequences are shown in CC comprising at least two functional regions - a binding domain with CC chemically or biologically active. They may further comprise a linker CC chemically or biologically active. They may further comprise a linker CC peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs CC compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, CC call. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody sequence 114 BP; 0 A; 2 C; 2 G; 2 T;

CC O70469 is a generic DNA sequence used to generate random TSAR peptide (TGC)(NNB)52(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction cc sites (X is not the same as Y) that are not specified further. This considered by these generic sequences are shown in 070465-68. Other specific peptides concatenated by these generic sequences are shown in R65150-54. TSARs are concatenated by these generic sequences are shown in R65150-54. TSARs are concatenated by these generic sequences are shown in R65150-54. TSARs are concatenated by these generic sequences are shown in R65150-54. TSARs are concatenated by these specific peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonuclectides are also designed in, or flanking, the contains 2 or 4 cysteine residues positioned in, or flanking, the contains 2 or 4 cysteine residues. These residues confer some degree of contains 2 or 4 cysteine residues. These residues confer some degree of contains 2 or 4 cysteine residues. These residues confer some degree of contains 2 or 4 cysteine residues. These residues confer some degree of contains 2 or 5 cysteine residues. These residues confer some degree of contains 2 or 5 cysteine residues. These residues confer some degree of contains 2 or 5 cysteine residues. These residues confer some degree of contains 2 or 5 cysteine residues. The stars or compans. comprising conference active modelies, eg. monoclonal or polyclonal antibodies conference and conference active models of hybridoma conference active models of hybridoma conference active models and activity a

/note="Vector: pT773D-Pac (Pharmacia) with a modified polylinker: lst strand cDNA was prepared from pooled bulk breast tumor tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT773 vector. Library is not normalized. (The normalized version of this library is NCI_CGAP_Br2.) Library was constructed by Bento Soares and M. Fatima Bonaldo."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It also relates to assay systems for detecting ligands to GDNFR alpha, systems for studying the physiological role of GDNFR, diagnostic techniques for identifying GDNF related conditions, methods for identifying molecules homologous to GDNFR alpha, and therapeutic techniques (claimed) for the treatment of GDNFR alpha, and and GDNFR alpha-related conditions, particularly kidney disease associated with glomerulonephritis and enteric nervous system
                                                                                                                                                                                                         Vascular endothelial growth factor 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New variants of lymphadenopathy associated virus (LAV) -
pr used for prodn. of DNA, antigens and antibodies used in
rediagnosis of AIDS and pre-AIDS
rediagnosis of AIDS and pre-AIDS
rediagnosis of AIDS and pre-AIDS
rediagnosis of AIDS and LAV MA L (N80437) were isolated from the peripheral
LAV EL I (N80436) and LAV MA L (N80437) were isolated from the peripheral
blood lymphocytes of patients. Different AIDS virus isolates concerned
care designated by 3 letters of the patients name. Stable probes including
the DNA sequences can be used for detection of the new LAV viruses or
related viruses or DNA proviruses in ep. biological samples. The proteins
or peptides can be used for detection of antibodies induced in vivo and
present in biological fluids. The DNA can also be used for the expression
of LAV viral antigens for the prodn. of a vaccine against LAV. The
collapse tides can also be used for the prodn. of antibodies for the
Category for the proteins related to the LAV viruses, partic. for diagnosis
of AIDS or pre-AIDS.

This full length vascular endothelial growth factor 2 (VEGF2) comprises 350 amino acids of which approx. the first 24 amino acids represent the leader sequence. VEGF2 is structurally related to the VEGF/PDGF family. It is partic. important that all eight cysteines are conserved within the members of the family. In addition, the signature for the PDGF/VEGF family, pxCYXXXCXGCCN, is conserved in VEGF2. VEGF2 induces growth of damaged bone, peridothum or ligament tissue. It is used for the promotion of endothelialisation in vascular graft surgery. Since anglogenesis is important in keeping wounds clean and non-infected, VEGF2 may be used in association with surgery and following the repair of cuts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-SEP-1995.

This polypeptide is a c.mpl ligand variant comprising amino acid residues 1-153 of c.mpl ligand (see W1996) fused via a linker (W15003) to amino acids 1-153 of c.mpl ligand and be used as a PCR template for generating novel forms of c.mpl ligand. Specifically claimed circularly permuted variants of c.mpl ligand (see W15005-16) are useful in the treatment of thrombocytopaenia and selective ex vivo expansion of haematopoietic stem cells.

Temp. resistant pseudorables virus - useful in vaccines as virus does not produce thymidine kinase. Disclosure; Fig. 5; 26pp; English.

The pseudorables virus (BUK-7)CC thymidine kinase coding sequence be mutated using a mutagen or deleted, so producing a virus (which is also modified to be temperature sensitive) which cannot produce functional thymidine kinase. Such a mutant is useful in a vaccine to control the spread of pseudorables virus. Vaccinated animals are also less likely to become carriers of the virus, and unlikely to require a dormant infection with pathogenic field strains. The mutagen-induced mutant is pseudorables virus (BUK 5A0 ATCC VR-2078, and may be lyophilised for storage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 8; Page : 106pp; English.

The sequences given in W1291-54 represents claimed analogues of native human mpl ligand. These analogues have altered glycosylation patterns. Alteration of glycosylation of mpl ligand can cause improved biological activity. The mutated proteins comprise a greater or lesser number of carbohydrate defines and higher or lower shallc acid content than wild type mpl ligand. Compositions comprising these mpl ligand analogues may be used to treat diseases involving an existing or expected megakaryocyte/platelet deficiency,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Elliott SG;

                                                                                                                                                                                                                                                                                                                                  PT lymphocyte veto molecule comprising response cell activating protein linked to molecule that targets stimulator cell marker, protein linked to molecule that targets stimulator cell marker, provided for selective suppression of immune response, e.g. prevention profession of the protein of graft rejection or treatment of auto-immune disease call in selection or treatment of auto-immune disease protein selective veto molecule is a chimeric molecule can protein polypeptide that binds a molecule, which differentiates can be used to a tragetting polypeptide that binds a molecule, which differentiates can be regulated in the autoimmune response.

CC a host cell from a tissue graft cell, or selectively targets a stimulator cell involved in the autoimmune response and constitution to call the protein binds a molecule that targets can be used to suppress an immune response and constitution of autoimmune diseases, e.g. systemic lupus carthematosus, myasthenia gravis, rheumatoid arthritis, insuling carthematosus, myasthenia gravis, rheumatoid arthritis, insuling can be molecule that differentiates graft and constitution of the protein binds a molecule that differentiates graft and constitution. The veto molecule can be used to reduce transplant rejection. The veto molecule can be used to reduce transplant to autoantigus, but leave other stimulator cells unaffected, e.g. containing egeneralised immuneraceion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

This sequence is the beta-subunit, CD18, of the leukocyte integrins. Peptides were designed based on the beta-subunit sequence and were tested for activity in the leukocyte/endothelial cell adhesion assay. See R22104-R22112.

                                                                                                                                                                                                                              CC The present sequence represents a NF-kappa inducing kinase (NIK). The CC full length DNA sequence was obtained by PCR using clone 10 (V03324). CC NIK was found to induce NF-kappaB even more effectively than TRAF2. CC Proteins capable of binding to TRAF2 and NIK were identified.

CC The NIK or TRAF-2 binding proteins can be used for modulation or CC mediation in cells of NF-kappaB activity or any other intracellular CC signalling activity modulated or mediated by TRAF2. TRAF-binding proteins CC are especially used for prevention or treatment of pathological CC conditions associated with NF-kappaB induction, e.g. acute hepatitis, CC autoimmune-induced cell death, e.g. death of the beta Langerhans cells or the pancreas that results in diabetes, the death of cells in graft CC rejection, the death of oligodendrocytes in the brain in multiple CC sclerosis, and AIDS-inhibited T cell suicide which causes proliferation of the AIDS virus and hence the AIDS disease. The proteins are also useful for screening of ligands capable of binding to a protein, which are useful for modulating cellular activity modulated/mediated by TRAF2. Sequence 947 AA;

                                                                                                                                                                                                                                                                    New fungal (hemi) cellulose degrading enzymes - for prodn. of liq. fuel gas and feed protein, have specified carbohydrate binding domain claim 20; Page 45; 73pp; English.

This CBD is homologous to a terminal A region of Trichoderma reesel cellulases and effects binding of a protein to an insoluble cellulosic or hemicellulosic substrate. It is one of ten specific CBD's (see R15244-R15253) which correspond to the generic CBD formulae in R15242 and R15243. The CBD is incorporated into a fusion protein comprising a catalytic domain from a cellulase, e.g. a second of the second constant of the constant

Example 1; Page 36; 49pp; English.

The amino acid sequence of the activation peptide (W00601) of rat pro-carboxypeptidase B (pro-CPB) was deduced from a cDNA sequence (see also T35759) obtd. by PCR amplification of Sprague-Dawley rat pancreas cDNA. The sequence of the mature enzyme (W00602) has also been deduced. Pro-CPB can be expressed in host cells, e.g. Escherichia coli, and subsequently recovered, refolded and cleaved with trypsin to yield the active enzyme. CPB produced this way is cheaper than porcine pancreatic enzyme, and is free of other
                          This protein comprises interleukin-3 variant 13288 fused to FXa, a synthetic linker and amino acids 1-153 of c-mpl ligand. It is encoded by E. coli expression plasmid, pMON26640. The native c-mpl ligand is also referred to as Megakaryocyte Growth and Development Factor (MGDF) or thromobopoietin (TPO). Variants and chimera of c-mpl ligand can have an improved biological profile, such as increased activity and/or decreased side effects, and/or improved physical properties, such as improved half-life, stability and/or re-fold efficiencies. They can be used for selective ex vivo expansion of stem cells, for the treatment of patients having a haematopoietic disorder or in human gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12-MAY-1997 (first entry)
IL-3 variant/FXA/GlySer/1-153 c-mpl ligand fusion protein.
IL-3 variant/ Megakarycoyte Growth and Development Factor; MGDF;
c-mpl ligand; Megakarycoyte Growth and Development Factor; MGDF;
thromobopoletin; TPO; variant; mutein; chimera; increased activity;
decreased side effect; ex vivo expansion; stem cell; treatment;
haematopoietic disorder; gene therapy; human; interleukin-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fulga N, Gorecki

It is encoded by E. coli expression plasmid, pMON26471. The native c-mpl ligand is also referred to as Megakaryocyte Growth and Development Factor (MSDF) or thromobopoletin (TPO). Variants and chimera of c-mpl ligand can have an improved biological profile, such as increased activity and/or decreased side effects, and/or improved physical properties, such as improved half-life, stability and/or re-fold efficiencies. They can be used for selective ex vivo expansion of stem cells, for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IL-3 variant/GlySer/1-153 c-mpl ligand fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 2; Page -; 74pp; English.

CC (sic) +W200R substitution. It is encoded by BHK expression plasmid CC pM0N26451-4 (T59343). It is a specific example of the variant c-mpl CC ligands of the invention. The native c-mpl ligand is also referred to CC as Megakaryocyte Growth and Development Factor (MGDF) or thromobopoietin CC (TPO). Variants and chimera of c-mpl ligand can have an improved CC biological profile, such as increased activity and/or decreased side CC effects, and/or improved physical properties, such as improved half-life, cstability and/or stem cells, for the treatment of patients having a CC vivo expansion of stem cells, for the treatment of patients having a Sequence 332 AA;
                                                                                                                                                                                                                                                                                                                                                                                          밁

Title: >US-08-866-354-4 (1-468) from US08866354.pep 3384

Description: Perfect Score: Sequence: 1 MFLATLYFALPLIDLLMSAE......PVLMLTALAALLSVSLAETS 468

Scoring table: PAM 150 Gap 11

Searched: 120441 seqs, 36531193 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir56 1:pir1 2:pir2 3:pir3 4:pir4 5:nrl3d

Statistics: Mean 46.167; Variance 82.676; scale 0.558

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
